# Outline of the talk

- Modelling disk chemistry

# Outline of the talk

- Modelling disk chemistry
- $^{13}\text{C}$  isotope chemistry in disks

# Outline of the talk

- Modelling disk chemistry
- $^{13}\text{C}$  isotope chemistry in disks
- Small species - HCN and  $\text{C}_2\text{H}_2$

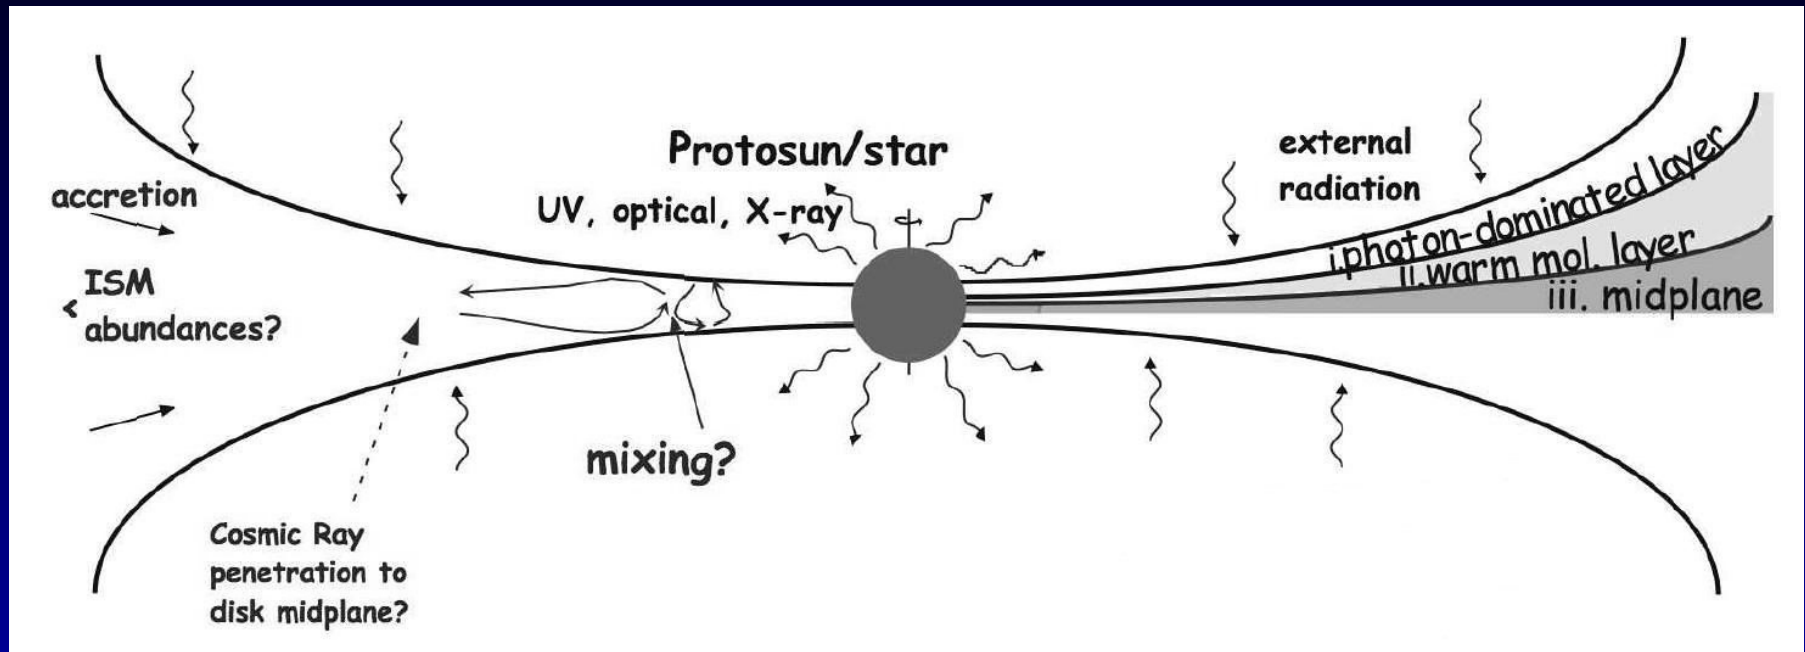

# Outline of the talk

- Modelling disk chemistry
- $^{13}\text{C}$  isotope chemistry in disks
- Small species - HCN and  $\text{C}_2\text{H}_2$
- Complex species - benzene and PAHs

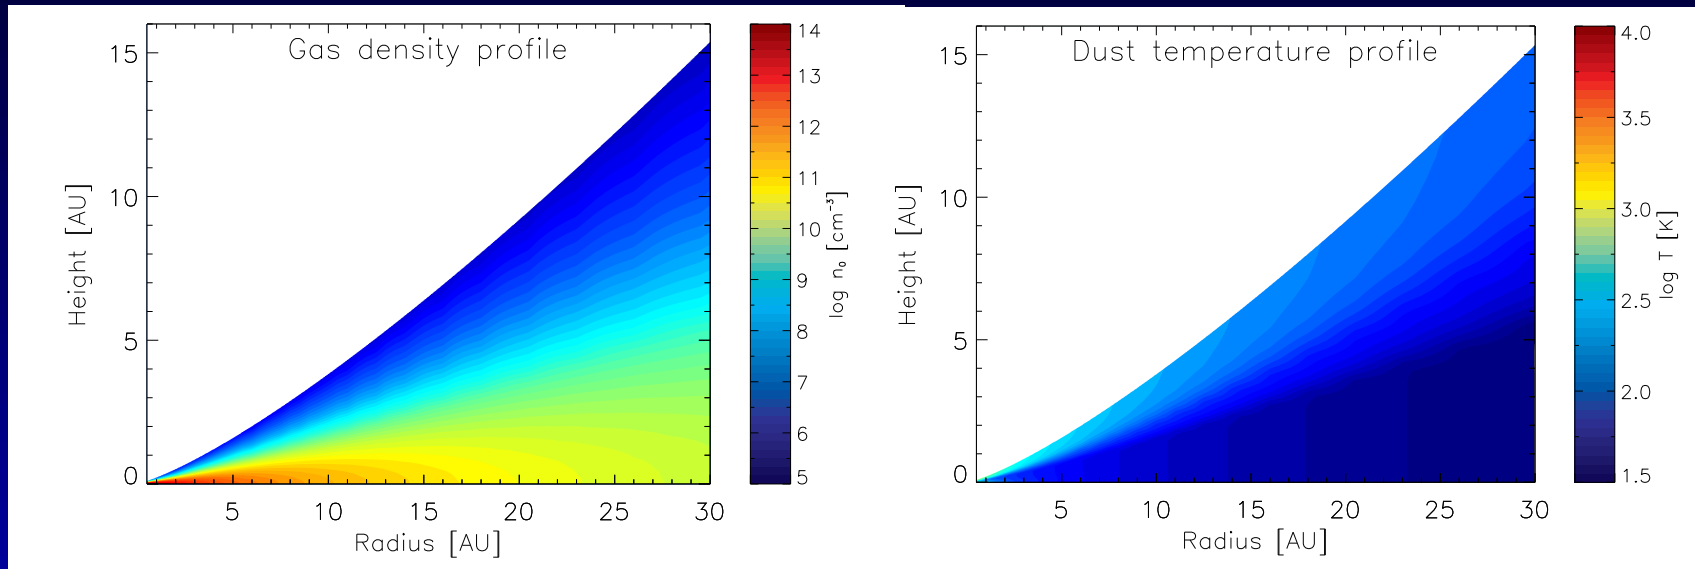

# A chemical view of disks

- i) Photon-dominated layer - mostly ions and radicals, e.g.  $C^+$
- ii) Warm molecular layer - many species in the gas phase, interactions between ions and neutrals
- iii) Midplane - most species frozen out onto grains

# Disk model

Model of D'Alessio et al. for a typical T Tauri disk

$$\dot{M} = 10^{-8} M_{\odot} \text{yr}^{-1}, \alpha = 0.01, M_{\star} = 0.5 M_{\odot},$$
$$R_{\star} = 2 R_{\odot}, T_{\star} = 4000 \text{ K}, L_{\star} = 0.9 L_{\odot}, \eta = 1$$

# Disk model

Model of D'Alessio et al. for a typical T Tauri disk

$$\dot{M} = 10^{-8} M_{\odot} \text{yr}^{-1}, \alpha = 0.01, M_{\star} = 0.5 M_{\odot},$$
$$R_{\star} = 2 R_{\odot}, T_{\star} = 4000 \text{ K}, L_{\star} = 0.9 L_{\odot}, \eta = 1$$

# Outline of the talk

- Modelling disk chemistry
- $^{13}\text{C}$  isotope chemistry in disks
- Small species - HCN and  $\text{C}_2\text{H}_2$
- Complex species - benzene and PAHs

# What can isotopes of C tell us?

- Trace the origin and evolution of molecules
  - Formation environment
  - Types of chemical processing
- Trace vertical temperature structure of disks (Dartois et al. 2003)
- Allow us to trace molecules which may be optically thick ( $^{12}\text{CO}$  vs.  $^{13}\text{CO}$ )
- Label various regions of the disk

# Carbon isotope chemistry

Rate measured by Watson et al. (1976), Smith & Adams (1980)

Rate calculated by Langer et al. (1984), Lohr (1998)

---

Rate measured by Smith & Adams (1980)

Rate calculated by Langer et al. (1984), Lohr (1998)

# Carbon isotope chemistry

$$k_{\text{for}} = 3.3 \times 10^{-10} (T/300 \text{ K})^{-0.448}$$

$$k_{\text{rev}} = k_{\text{for}} \exp(-35 \text{ K}/T)$$

Woods & Willacy (2007, in prep.)

---

$$k_{\text{for}} = 2.6 \times 10^{-10} (T/300 \text{ K})^{-0.277}$$

$$k_{\text{rev}} = k_{\text{for}} \exp(-9 \text{ K}/T)$$

Woods & Willacy (2007, in prep.)

# Inputs: the local $^{12}\text{C}/^{13}\text{C}$ ratio

Hawkins & Jura (1987)	$43 \pm 4$
Goto et al. (2003)	$57 \pm 5$
Langer & Penzias (1993)	$62 \pm 4$
Langer & Penzias (1990)	$\sim 70$
Stahl & Wilson (1992)	$71 \pm 3$
Stahl et al. (1983)	$77 \pm 3$
Goto et al. (2003)	$86 \pm 49$
Penzias (1983)	$100 \pm 14$
Vladilo et al. (1993)	98–120
Goto et al. (2003)	$137 \pm 9$
Goto et al. (2003)	158

# Galactic $^{12}\text{C}/^{13}\text{C}$ ratio

Milam et al. (2005)

# Input abundances

$$\frac{^{12}\text{C}^+}{^{13}\text{C}^+} = 77 \Rightarrow$$

$10^6$  yr

$$\Rightarrow \frac{^{12}\text{CO}}{^{13}\text{CO}} = 59$$
$$\Rightarrow \frac{^{12}\text{C}}{^{13}\text{C}} = 82 \Rightarrow$$
$$\frac{\text{H}_2^{12}\text{CO}}{\text{H}_2^{13}\text{CO}} = 91$$

$\Rightarrow ?$

$$\frac{^{12}\text{C}^+}{^{13}\text{C}^+} = 89 \Rightarrow$$

$10^6$  yr

$$\Rightarrow \frac{^{12}\text{CO}}{^{13}\text{CO}} = 68$$
$$\Rightarrow \frac{^{12}\text{C}}{^{13}\text{C}} = 95 \Rightarrow$$
$$\frac{\text{H}_2^{12}\text{CO}}{\text{H}_2^{13}\text{CO}} = 105$$

$\Rightarrow ?$

# Carbon isotopes - CO

# Carbon isotopes - CO

# Carbon isotopes - CO

Gibb et al. (2007), GV Tau:

$$T(^{12}\text{CO}) \approx 240 \text{ K}$$

$$^{12}\text{CO}/^{13}\text{CO} = 54 \pm 15$$

Brittain et al. (2005), HL Tau:

$$T(^{12}\text{CO}) \approx 100 \text{ K}$$

$$^{12}\text{CO}/^{13}\text{CO} = 76 \pm 9$$

# Carbon isotopes - CH<sub>4</sub>

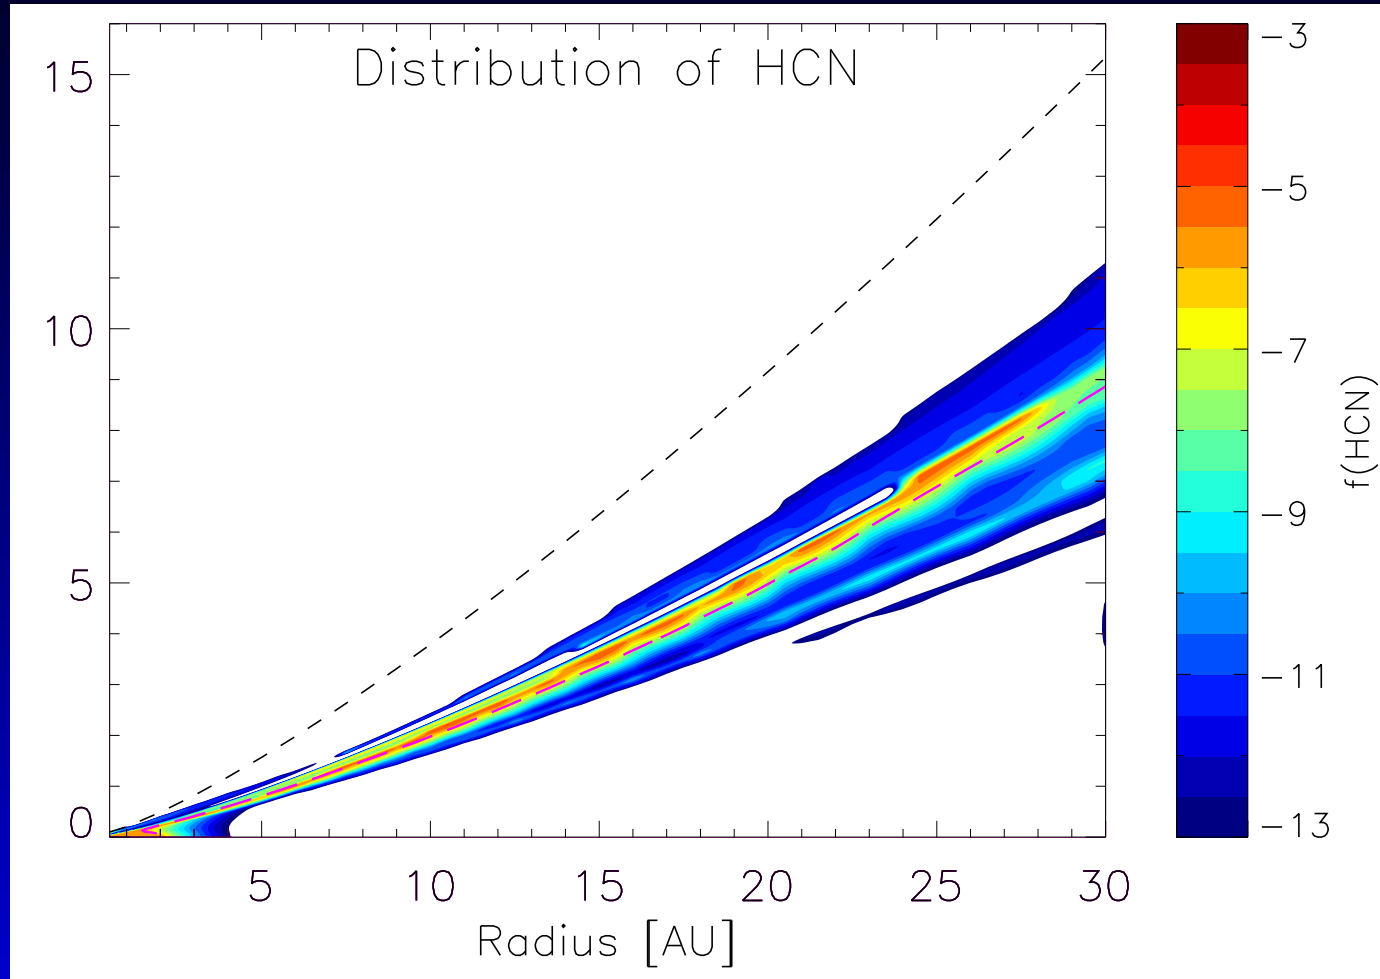

# Outline of the talk

- Modelling disk chemistry
- $^{13}\text{C}$  isotope chemistry in disks
- Small species - HCN and  $\text{C}_2\text{H}_2$
- Complex species - benzene and PAHs

# Simple molecules - HCN, C<sub>2</sub>H<sub>2</sub>

GV Tau:  $T(\text{HCN}) \sim 115 \text{ K}$  (Gibb et al. 2007)

# Simple molecules - HCN, C<sub>2</sub>H<sub>2</sub>

GV Tau:  $T(\text{C}_2\text{H}_2) \sim 170 \text{ K}$  (Gibb et al. 2007)

# Outline of the talk

- Modelling disk chemistry
- $^{13}\text{C}$  isotope chemistry in disks
- Small species - HCN and  $\text{C}_2\text{H}_2$
- Complex species - benzene and PAHs

# Forming complex species

# Forming complex species

# Complex species - $C_6H_6$

Woods & Willacy, 2007, ApJ, 655, L49

# PAHs

Allamandola et al. (1989)

# PAHs

PAHs have been observed in T Tauri disks:  
e.g., Geers et al. (2006)

PAHs may form in the gas phase in AGB stars:  
e.g., Frenklach & Feigelson (1989), Cherchneff et al. (1992)

Regions of high density with long residency times occur in the inner regions of disks. Do the right ingredients (benzene, acetylene) mix at the right temperatures (700–1 100 K)?

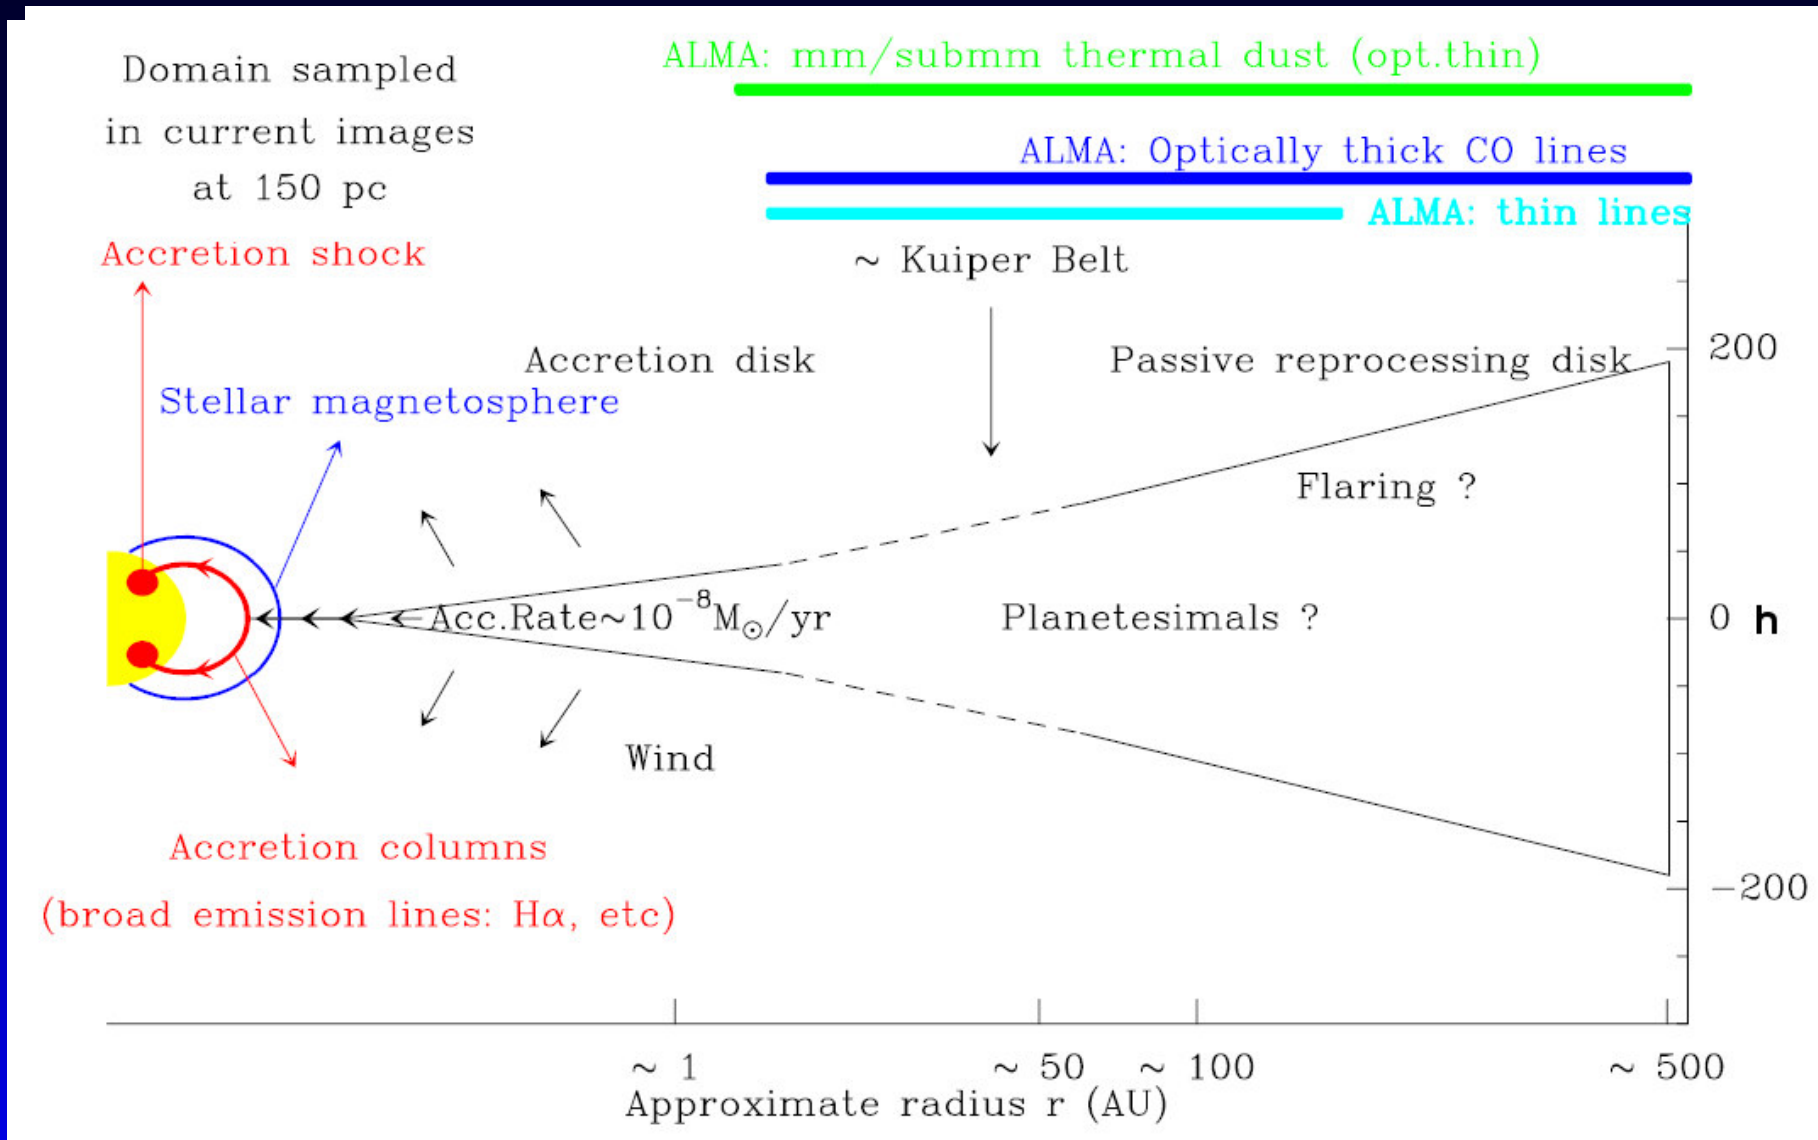

# Impact of ALMA on chemistry

- ALMA will allow us to resolve different chemical regions - both vertically and radially
- Sub-arcsecond resolution at the distance of local star-forming regions such as Taurus and Orion will let us probe inside 10 AU
- ALMA will be able to probe the cold gas at  $R < 30$  AU, and discover the chemically important regions where molecules come off grains
- High spectral resolution that will help us to separate very narrow lines in the line forest
- Observers will be able to map species and physical conditions at a much higher resolution than currently possible, and help modellers to refine their models.
- Models will give observers densities, temperatures, and more importantly, the location of species of interest

# Impact of ALMA on chemistry

Dutrey et al. (2005)

# Carbon isotopes - CO

# Complex species - $C_6H_6$

# What happens next?
